

Telegraph

The network that turns intelligence into a graded commodity.

Ranked by performance. Driven by demand.

How a diamond is graded.

Measure it once against a shared standard - and a rough stone becomes a tradable commodity.

A diamond never changes. Grade it once - the grade holds forever.

Intelligence never stands still.

New models every week. Yesterday's best is today's average.

A grade given once is wrong within weeks. Intelligence has to be graded continuously.

You can't grade a dynamic commodity once.

The intelligence exists. The market that grades it does not.

Introducing Telegraph.

Telegraph continuously evaluates competing providers for each Intent, making heterogeneous intelligence comparable and rankable by performance. Paid demand can then flow through those rankings, turning intelligence from scattered supply into a graded economic commodity.

The better the supply performs, the more economic opportunity it can earn. And because Evaluators themselves compete to improve how performance is measured, both the intelligence and the market around it can keep improving.

Four roles. One continuous loop.

Every task. Every round. Forever.

Providers are graded per task on measured performance - not individual answers.

One market per task.

An Intent is a defined task. Providers are ranked separately in every one.

	WEATHER	FRAUD	DEEPPFAKE	RISK SCORING
Model A	#1	#3	#4	#2
API B	#3	#1	#2	#4
Dataset C	#2	#4	#1	#3
Tool D	#4	#2	#3	#1

Best at fraud is rarely best at weather. So intelligence is graded task by task.

Two markets compete.

The intelligence improves - and so does the way it is measured.

Providers

compete to supply intelligence

Any model, API, dataset or tool

Higher rank = more demand

Paid only when demand is served

+

Evaluators

compete to measure performance

Anyone can submit a better test

Hidden verification decides

The winner becomes Canonical

The measurement itself is replaceable.

A better test can take over any Intent.

Validators verify and finalize.

They don't judge intelligence. They prove the process ran correctly.

How a ranking is produced.

Continuously, in the background, per Intent.

Demand follows the ranking.

Higher rank, more requests. Never winner-takes-all.

Illustrative shares. Routing weights are protocol parameters.

Nobody can buy the top spot.

The flywheel.

MACHINA.

The economic unit of intelligence. Consumers pay in USDC - Providers settle in MACHINA.

Every paid request creates open-market demand for MACHINA.

Fixed supply. Fair launch.

No pre-mine, no team tokens, no VC allocation. Pure fair launch, like Bitcoin, from day 1.

21M

max supply

7,200

MACHINA per day at genesis

~4yr

halvings

WHERE EMISSIONS GO

60% Validators

20% Evaluators

20% Treasury

Providers 0%

Providers earn only from paid demand.

Alexandria finishes the job.

Telegraph grades the intelligence. Alexandria turns it into outcomes.

Alexandria, in beta.

Proof from Season I.

The network opened. Every side of the market showed up.

65.2M

impressions

130K+

intelligence requests via x402

1,500+

Providers

45

apps built

2,000+

registered developers awaiting mainnet

\$1.80

per developer acquired

Different work, same mechanism.

Bitcoin opened mining to the world. Telegraph opens it to intelligence.

	BITCOIN	BITTENSOR	TELEGRAPH
Work	Secures a ledger	Subnet intelligence	Serves an Intent
Hardware	ASICs	GPUs	An existing API
Upfront	\$4K - \$10K+	\$500 - \$2K+	Registration bond
Paid from	Block rewards	Emissions	Paid demand

How demand arrives.

Phase 1
Crypto-native

Phase 2
Institutions and labs

Phase 3
Enterprise operators

Bootstrap traffic is labelled separately and never counted as paid demand.

What Telegraph is not.

~~An L1~~

settles on Ethereum

~~A rollup~~

only commitments go on-chain

~~An oracle~~

grades produced intelligence

~~An AI lab~~

owns no models

~~A price router~~

routes on performance

~~A reseller~~

98% goes to Providers

How Telegraph competes.

	OPENROUTER	CHAINLINK	TELEGRAPH
Scope	LLMs	Observable facts	Any intelligence, per Intent
Routes on	Price, latency	Committee median	Measured performance + competitive evaluation
Supply	Curated	Permissioned	Permissionless
Proof	None	Attestation	Receipt + finalized ranking

The opportunity.

A new layer of the internet for the machine economy.

Graded intelligence

a commodity market for every task

Measurement market

better tests win, permissionlessly

Robots

every perception step graded

Machine provenance

an audit trail for machine decisions

Forecast.

\$500M protocol revenue = 0.83% of 82B daily AI transactions (Gartner, 2030).

Modelled 2% protocol fee revenue.

Team.

Mark Basa 

CEO & Co-founder

Bitcoin loyalty app, two Microsoft incubators (2011)
Led Bittensor's early PR - 550+ earned articles
7-figure node agency; brand director, L1
Co-founded a Web3 studio backed by top Japanese VCs

Ahmed Ali 

CTO & Co-founder

Architected the Telegraph protocol
6 years building blockchains from scratch
Forked the Optimism stack for Epic Chain
Certified Blockchain Architect

Evan Slattery 

Growth

ex-Coinbase; MSc, BEng aerospace

Haider Ali 

Senior Distributed Systems

Backend developer at Basebox

Umar Gujjar 

Web3 & Backend API

Polygon hackathon winner

Talha Sajid Chaudhary 

Full Stack

Smart contracts for Pear Protocol

Usman Siddiqui

AI/ML Engineer

MSc CS, silver medal
